Thymosin Alpha-1 | Immune Reconditioning, Infection Defense & Chronic Illness Support

The immune system's master regulator — *a naturally occurring thymic peptide that restores T-cell competence, balances immune response, and supports the body's ability to fight infection, clear pathogens, and resolve chronic immune dysregulation.*

What Is Thymosin Alpha-1?

Thymosin Alpha-1 (TA1) is a 28-amino acid peptide naturally produced and secreted by the thymus gland — the central organ of immune education and T-cell maturation. It was first isolated and characterized in the 1970s by Dr. Allan Goldstein, and has since become one of the most clinically studied immunomodulatory peptides in the world.

Thymic output of TA1 declines significantly with age as the thymus gradually involutes, contributing to the age-related immune incompetence, increased infection susceptibility, and immune dysregulation that characterize immunosenescence.

Primary Mechanisms of Action

- Builds Stronger Immune Cells Supports your thymus gland in producing mature, fully functional immune cells that are better equipped to identify and respond to viruses, bacteria, and abnormal cells.
- Balances Your Immune Response Helps calm over-reactive patterns linked to allergies, asthma, and autoimmune conditions — while keeping your immune system strong enough to clear real threats.
- Activates Your Natural Defenses Boosts Natural Killer (NK) cells — your immune system's rapid-response unit — enhancing their ability to seek out and destroy virus-infected and abnormal cells.
- Reduces Chronic Inflammation Regulates the chemical messengers that drive immune activity, amplifying targeted responses when needed while quieting unnecessary, lingering inflammation.

Key Benefits

→ Immune System Reconditioning
Restores functional T-cell competence in patients with immune senescence, post-illness depletion, or chronic immune dysregulation. Particularly valuable when the immune system has lost its ability to mount coordinated antigen-specific responses.

→ Chronic Viral Infection Support
Clinically studied and approved for chronic hepatitis B and C. Supports immune clearance of persistent viral infections including EBV, CMV, HHV-6, and chronic Lyme-associated co-infections.

→ Post-COVID & Long-Haul Recovery
Addresses the T-cell exhaustion and immune dysregulation seen in post-COVID syndrome and long-haul illness. Helps restore the immune system's ability to clear persistent viral antigen and resolve neuroinflammation.

→ CIRS / Mold Illness & Biotoxin Recovery
Supports restoration of proper immune surveillance in patients whose innate and adaptive immune systems have been dysregulated by biotoxin exposure. Works alongside other CIRS protocols to rebuild functional immune response.

→ Cancer Adjunct Therapy
Used internationally as an adjunct to conventional cancer treatment to preserve and restore immune function during chemotherapy and radiation. Supports NK cell activity and T-cell cytotoxicity against tumor cells.

→ Vaccine Response Enhancement
Clinically shown to improve antibody response and immune memory formation following vaccination — particularly valuable in immunocompromised patients or those with blunted vaccine responses.

→ Autoimmune Modulation
Rather than suppressing immunity broadly, TA1 intelligently rebalances Th1/Th2/Treg ratios — reducing pathological immune overactivation while restoring appropriate defense capacity.

Clinical Applications at Larrea

- Chronic viral reactivation (EBV, CMV, HHV-6, HSV)
- Post-COVID immune reconstitution and long-haul support
- CIRS / mold illness immune restoration
- Chronic Lyme disease and co-infection immune support
- MCAS & Allergies — immune preservation during treatment
- Recurrent infections and low immune resilience
- Immune senescence / age-related immune decline
- Autoimmune rebalancing alongside other naturopathic protocols

What You May Notice

TA1 works gradually, rebuilding immune function over weeks to months. Patients often report:

- Fewer and less severe infections over time
- Improved energy and reduction in post-viral fatigue
- Faster recovery when illness does occur
- Reduction in chronic inflammatory symptoms
- Greater overall resilience and immune confidence

Dosing & Administration

Route	Typical Protocol	Frequency	Clinical Notes
Subcutaneous injection	Standard: 1.5mg per injection; protocols typically 2x/week for 8-12 weeks	Twice weekly or per provider protocol	Most established delivery route. Dose and duration individualized based on clinical indication. Maintenance dosing (1x/week or monthly) may follow an induction course. Well-tolerated with an excellent long-term safety record.
Intensive protocols	Higher frequency and duration per oncology-informed protocol	Up to daily dosing in intensive clinical contexts	Used in oncology adjunct settings at higher frequency. Coordinate with treating oncologist. TA1 does not interfere with most standard chemotherapy or radiation protocols.

Dose and duration individualized by your provider based on clinical indication and immune status. $275 for 5ml (1 month) .

Safety & Tolerability

Thymosin Alpha-1 has an outstanding safety profile with decades of international clinical use:

- Exceptionally well-tolerated — one of the safest peptides in clinical practice
- No significant organ toxicity or serious adverse events reported in decades of clinical use
- Mild, transient injection site reactions possible (redness, slight tenderness)
- Does not broadly suppress immunity — it modulates and restores balance rather than suppressing
- Safe to use alongside most naturopathic, functional, and conventional medical protocols
- FDA Orphan Drug designation for DiGeorge syndrome; approved in 35+ countries

Compatibility with Other Protocols

TA1 integrates well across immune, longevity, and recovery protocols:

- Pairs with BPC-157 and TB-500 for post-infectious recovery combining gut healing, tissue repair, and immune reconditioning
- Complements FOXO4-DRI in longevity protocols — clearing senescent immune cells while TA1 rebuilds T-cell competence
- Works alongside Larazotide for gut-immune axis restoration in CIRS, autoimmune, and leaky gut presentations
- Synergistic with IV nutrient therapy (high-dose vitamin C, zinc, glutathione) for acute and chronic infection support
- Compatible with HRT protocols — hormonal balance supports immune function, and TA1 supports hormone-related immune regulation
- Can be added to GLP-1 protocols where chronic inflammation and immune dysregulation are contributing to metabolic dysfunction
